# Introduction

---

The Joint Advanced Distributed Simulation (JADS) Joint Test Force (JTF) is investigating the utility of advanced distributed simulation (ADS) technology for test and evaluation (T&E). JADS is executing three tests representative of portions of the T&E testing spectrum to obtain data for its evaluation. These tests linked live test assets, constructive models, and virtual simulations at multiple test facilities and test ranges across the country.

Science Applications International Corporation (SAIC) developed a software product called the **JADS Analysis Toolbox** that has been very helpful in the evaluation of the JADS tests. The toolbox comprises a set of C++ routines integrated into a single user interface. Users can view tabulations and plots of protocol data units (PDU) data in near real time, can replay or get selected data in a text-readable format from the JADS logfile(s) post test, and can obtain predefined plots and tabulations of PDU statistics for post-test analyses.

The toolbox's main window allows users to select tools appropriate to their needs.

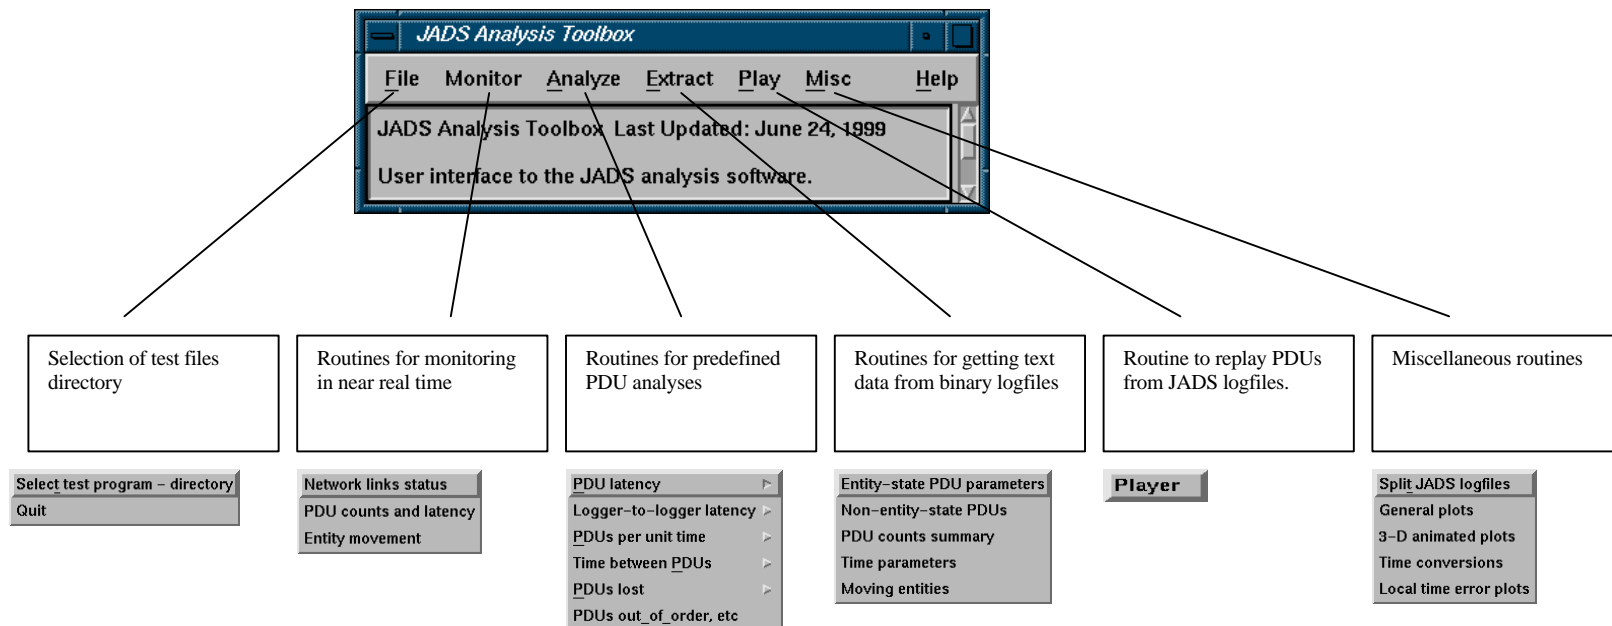

As shown in the diagram, tools have been sorted into 5 major categories:

- Monitor tools provide the user with analysis data in near real time
- Analyze tools provide the user with predefined analyses and outputs
- Extract tools provide the user with text data from the binary logfiles
- Play tools provide the user with the ability to replay PDUs from a logfile
- Miscellaneous tools provide the user with the ability to split JADS logfiles, etc.

Each of these tools will be described in more detail.

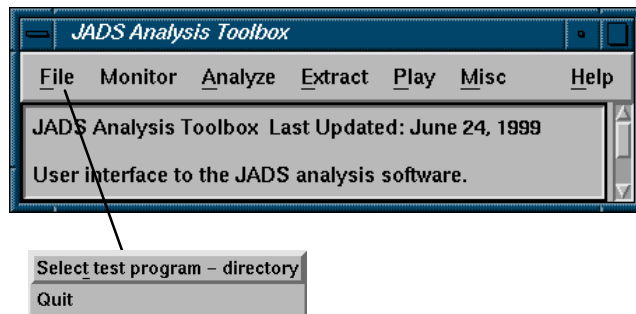

# Introduction

# 1. File

The **File** menu allows the user to select the test program. A dialog shows the currently available test programs which the user may select from. The test program name is used as the name of the directory where toolbox routines will look for logfiles and where output data will be placed. Logfiles must be stored and named as follows:

Logfiles must be stored in the directory `$LOGS_DIR/<test_program>/<date>/logfile.log` where

`$LOGS_DIR` is the UNIX™ environment variable that defines the directory where test data logs and results are stored.

`<test_program>` is the directory (under the `$LOGS_DIR`) for a given test program.

`<date>` is the directory (under `<test_program>`) for data from the test date. It is a 6-digit (mmddyy) string.

logfile is the name of the logfile. The appendix, '.log' designates a logfile created using the JADS logger.

Logfiles must use the naming convention `mmddyy_testxx_locn.log` where

mmddyy is the date of the mission (6 digits)

test can be any set of characters such as 'test', 'trial', 'exercise', etc.

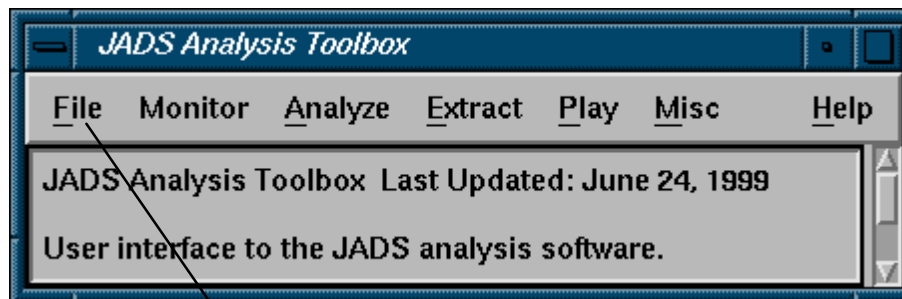

xx is two (or more) digits that specify the test number within the mission

locn is an alphanumeric string designating the location (node) of the logger

Output files created by the toolbox routines are stored in the directory `$LOGS_DIR/<test_program>/<date>/results`.

# 1. File

Quit

## 2. Monitor

---

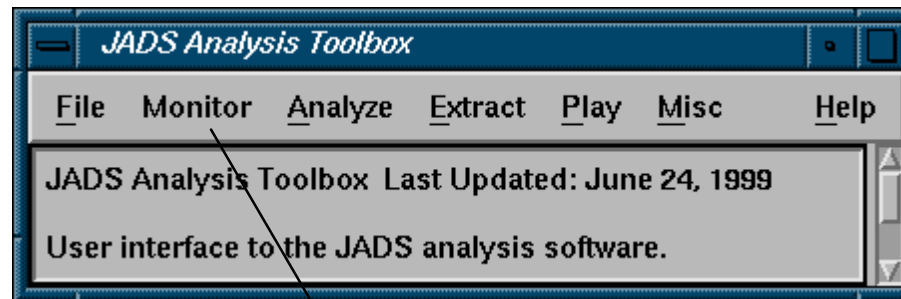

The toolbox **Monitor** menu has three menu items: **Network links status**, **PDU counts and latency**, and **Entity movement**.

These routines allow the analyst to view various PDU data in near real time in tabular and/or plot form. The routines are described on pages 10 - 15.

## 2. Monitor

Network links status  
PDU counts and latency  
Entity movement

## 2.1 Network Links Status

The **Monitor - Network links status** menu item calls up a dialog that allows the user to enter parameters before calling link\_status. This dialog allows the user to browse for the hosts\_file (a text file that contains the names of hosts on the network which will be pinged by this program) and to define the following parameters which are used by the ping command in link\_status:

time_between_packets	integer number of seconds
packet_size	integer number of bytes
number_packets per ping	integer number

The link\_status program will show a stoplight display. The stoplight display will show either red, yellow, or green as a status for each of the hosts in the hosts file.

If ping time is greater than 500 msec or packet loss is greater than 0,	the ping is considered BAD
otherwise	the ping is considered GOOD

If the current ping is GOOD,	the status is displayed as GREEN
If the current ping is BAD, but the previous ping was GOOD,	the status is displayed as YELLOW
If the current ping is BAD, and previous ping was also BAD,	the status is displayed as RED

Output of the program is written to \$TMP\_DIR/link\_status.mmddyy, where mmddyy are six digits representing the current date, and \$TMP\_DIR is an environment variable defining where temporary files may be written.

## 2.2 PDU Counts and Latency

The **Monitor - PDU counts and latency** menu selection brings up the **PDU Monitor** main window. Its menus, dialogs, and outputs are shown on the facing page.

The **File** menu allows the user to **Change Port** from which data are being received.

The **PDU Statistics** menu items are the following:

- |                       |   |
|-----------------------|---|
| <b>Show Stats</b>     | brings up the <b>PDU Statistics</b> window.     |
| <b>Close Stats</b>    | closes the <b>PDU Statistics</b> window.        |
| <b>Show Entities</b>  | brings up the <b>Entities Received</b> window.  |
| <b>Close Entities</b> | closes the <b>Entities Received</b> window.     |
| <b>Reset</b>          | resets the statistics shown in the two windows. |

The **PDU Latency** menu items are the following:

- |                   |   |
|-------------------|---|
| <b>Show Plot</b>  | displays a plot of PDU latency (received time - PDU time) versus PDU received |
| <b>Close Plot</b> | closes the plot   |
| <b>Reset Plot</b> | resets the plot   |

## 2.3 Entity Movement

The **Monitor - Entity movement** brings up the **realtime\_3d** main window that provides a 3-D display of position for up to 3 entities. Its menus, dialogs, and outputs are shown on the facing page.

**realtime\_3d** has the following menu items:

**File menu** has the following menu items

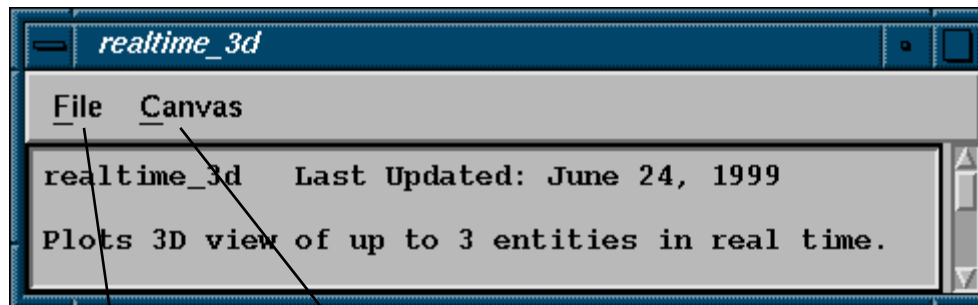

<b>Select Entities</b>	lets user select up to 3 entities
<b>Start Run</b>	starts receiving PDUs and plotting
<b>Stop Run</b>	stops receiving PDUs and plotting
<b>Change Port</b>	changes the port data are received from
<b>Exit</b>	terminates the program

The **Canvas Menu** has the following menu item

<b>3D View</b>	provides arrows that control 3D viewing angles

### 3. Analyze

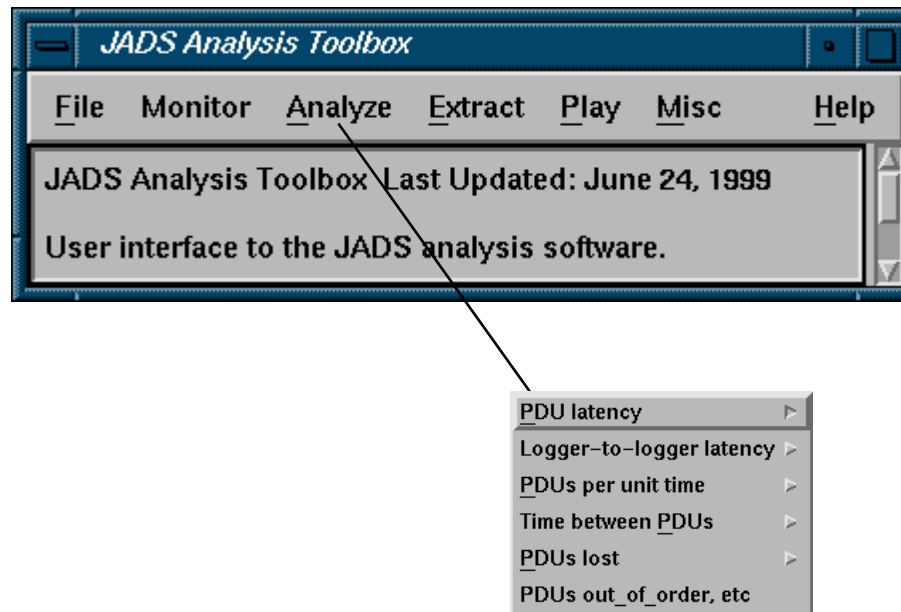

The **Analyze** menu can be used to call up routines that have predefined analysis functions.

Each of these routine's main window, dialogs and sample outputs are shown on pages 18 - 29.

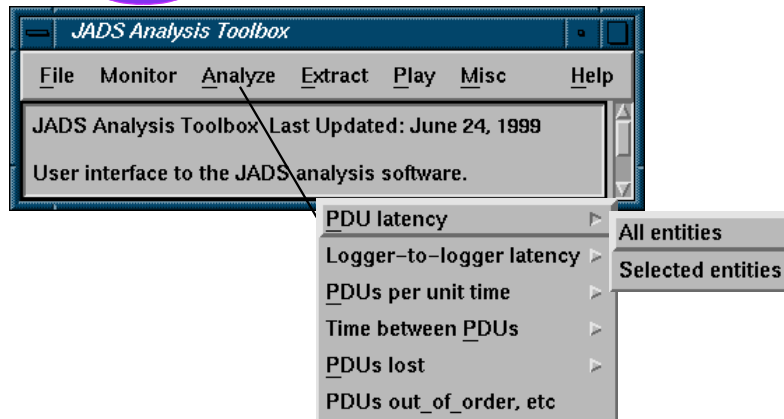

### 3. Analyze

## 3.1 PDU Latency

The **Analyze - PDU latency** (**All entities** or **Selected entities**) menu items provide plots of PDU latency (log time - PDU time) for all or selected entities. Data are obtained from .gnu files.

Gnu files are JADS logfiles that have been converted to text and that contain

entity id	latitudedegrees
log time msec	longitude degrees
PDU time msec	altitudefeet

The **Logfile\_converter** that creates the .gnu files adds the hour from the first log time to the PDU time and keeps track of hour rollovers so that the PDU time has a 24 hour basis just as the log time. If .gnu files are not available for the desired mission, test, and logger, use **Logfile\_converter** from the file menu to create them.

The **canvas** menu allows the user to format the plot. Plots may be printed using the file menu. The figure shows PDU latency for a selected entity.

## 3.1 PDU Latency

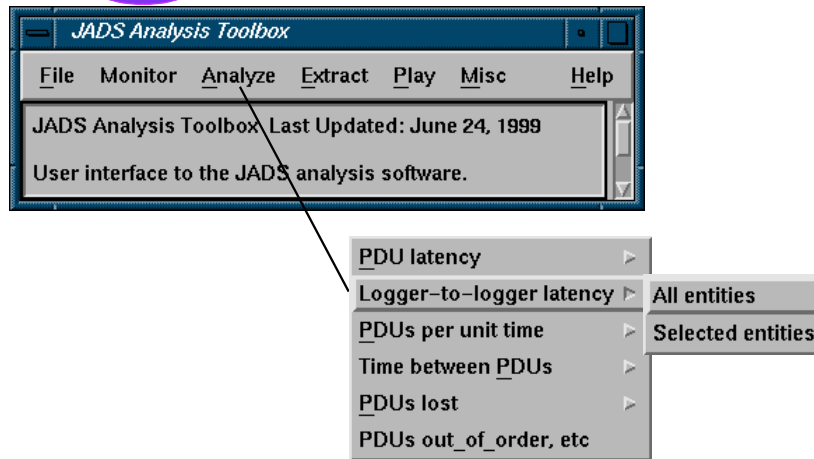

Compute Latency for an entity  
Logfile\_converter  
Print  
Quit

## 3.2 Logger -to-Logger Latency

The **Analyze - Logger-to-logger latency** menu item allows the user to compute and plot the latency of PDUs as they travel from one logger to another (for **All entities** or **Selected entities**). Data are obtained from .gnu files.

Latency is computed by finding the same PDU at the two loggers and subtracting the base logger log time from the other logger log time.

If .gnu files are not available for the desired mission, test, and logger, use **Logfile\_converter** from the file menu to create them.

The **canvas** menu allows the user to format the plot. Plots may be printed using the file menu.

## 3.2 Logger -to-Logger Latency

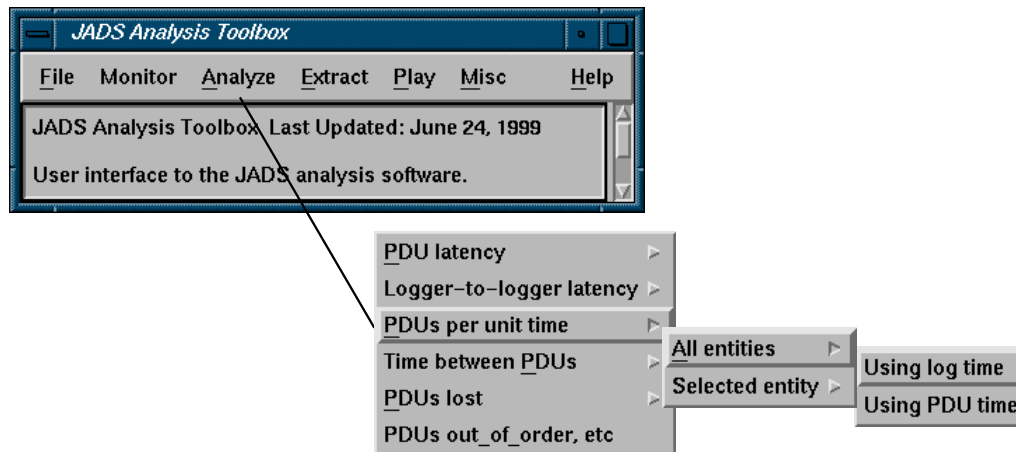

Compute Latency for all entities  
Logfile\_converter  
Print  
Quit

## 3.3 PDUs Per Unit Time

The **Analyze - PDUs per unit time** menu item allows the user to compute and plot the number of PDUs per second (**Using log time** or **Using PDU time**) (for **All entities** or **Selected entities**).

Data are obtained from .gnu files.

If .gnu files are not available for the desired mission, test, and logger, use **Logfile\_converter** from the file menu to create them.

The **Canvas** menu allows the user to format the plot.

Plots may be printed using the file menu.

## 3.3 PDUs Per Unit Time

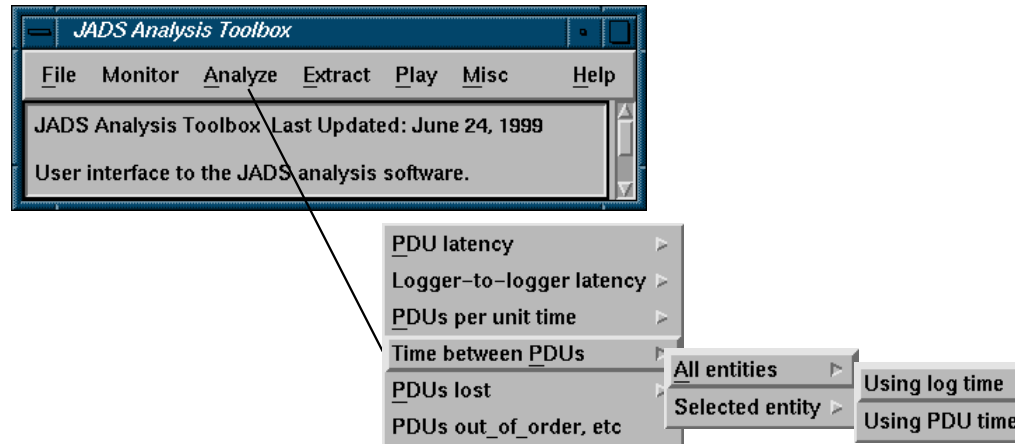

Compute PDUs per second of log time  
Logfile\_converter  
Print  
Quit

## 3.4 Time Between PDUs

The **Analyze - Time between PDUs** menu item allows the user to compute and plot the time (**Using log time** or **Using PDU time**) between successive PDUs (for **All entities** or **Selected entities**).

Data are obtained from .gnu files.

If .gnu files are not available for the desired mission, test, and logger, use **Logfile\_converter** from the file menu to create them.

The **Canvas** menu allows the user to format the plot.

Plots may be printed using the file menu.

## 3.4 Time Between PDUs

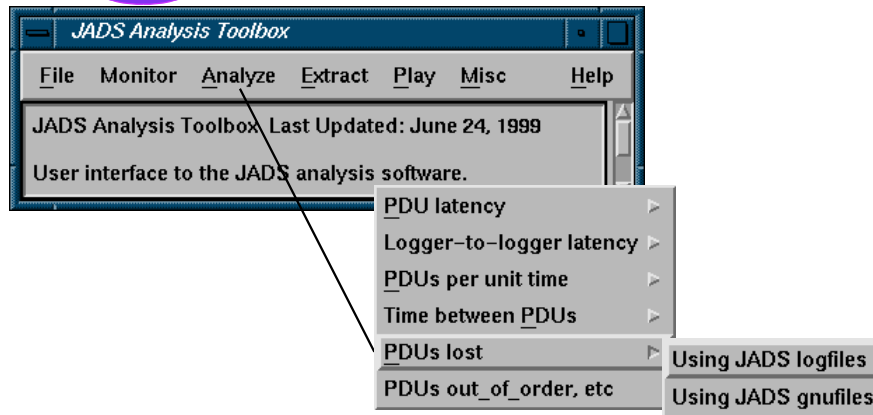

Compute log time between PDUs for all entities  
Logfile\_converter  
Print  
Quit

## 3.5 PDUs Lost

The **Analyze - PDUs lost** menu item allows the user to compare PDUs recorded at a source logfile to PDUs recorded at a target logfile. PDUs recorded at the source but not at the target are reported as lost PDUs.

The computation may be performed **Using JADS logfiles** or **Using JADS gnufiles**.

Selected data from the first and last missing PDU are printed for missing PDUs blocks.

## 3.6 PDUs Out of Order, etc.

The **Analyze - PDUs out\_of\_order, etc** menu item brings up the **PDU\_statistics** main window.

The **PDU\_statistics** main window allows the user to select .gnu files for which statistics are desired. As each file is selected, the program prints the following for each entity found in the file:

- number of PDUs
- the number of PDUs out of order
- the number of PDU gaps (log time between PDUs greater than 0.5 seconds)
- the number of duplicate PDUs
- the minimum, maximum, and average latency (logged time minus PDU time)

These are very useful data especially in the early days of testing an ADS architecture, as faulty architectural components can easily cause PDUs to be received out of order, duplicate PDUs, or excessive latencies.

## 3.6 PDUs Out of Order, etc.

```
pdu_statistics
```

File

pdu\_statistics    Last Updated: June 7, 1999

Reads a JADS .gnu file and tabulates various PDU statistics

If .gnu files are not avail for desired mission-test-logger  
use logfile\_converter from the file menu to create them  
from the JADS logfile (.log).

## 4. Extract

The **Extract** menu allows the user to extract selected data and/or statistics from the JADS logger binary files as text data. Extracted data are typically saved as a file. The various extraction routines are explained on pages 32-41.

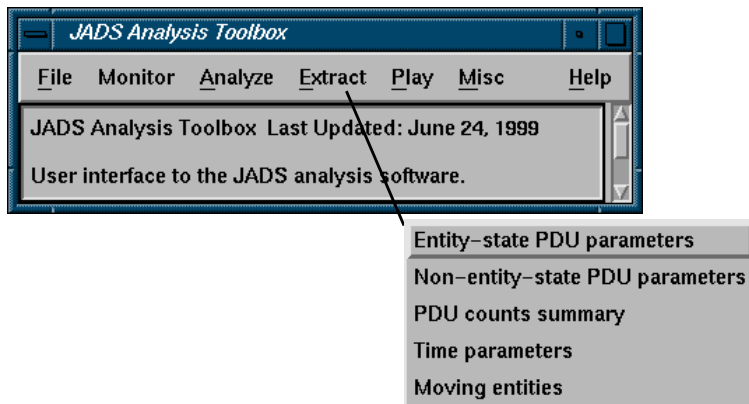

## 4. Extract

- Entity-state PDU parameters
- Non-entity-state PDU parameters
- PDU counts summary
- Time parameters
- Moving entities

## 4.1 Entity-State PDU Parameters

The **Extract - Entity-state PDU parameters** menu item brings up the **entity\_state\_pdu\_parameters** routine. This routine allows users to select a JADS logfile and to print parameters from entity-state PDUs to a file in ASCII format for subsequent analyses.

The **File** menu activates the selection of the file to print from, as well as the **Select Entity State Parameters** dialog from which the user may select the PDU parameters to be printed.

The main window will display the location of the source logfile and resulting printed output file. PDU data are extracted from this file to an output file with the appendix '.jprm'.

This routine is frequently used to generate text-readable output that is transported to MS-DOS® platforms and analyzed there.

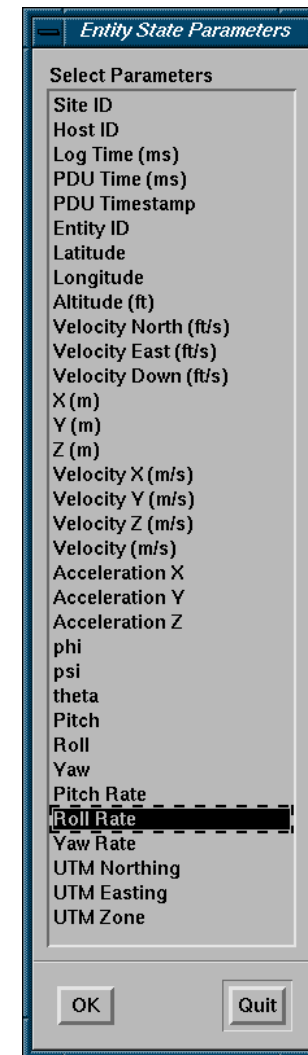

## 4.1 Entity-State PDU Parameters

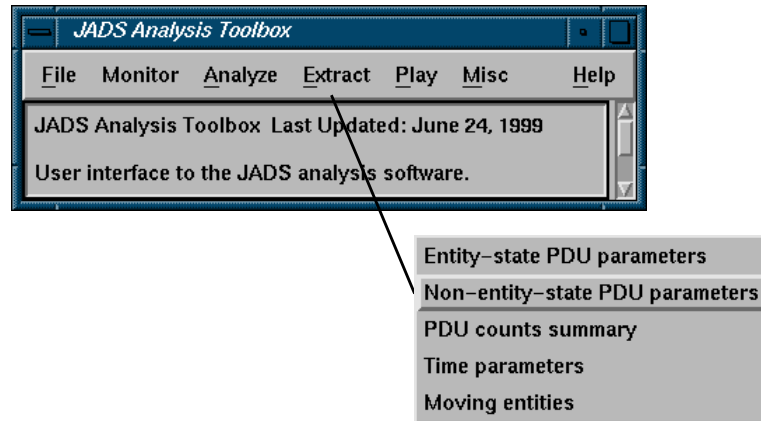

Select Entity State Params  
Quit

## 4.2 Non-Entity-State PDU Parameters

The **Extract - Non-entity-state PDU parameters** menu item brings up the **non\_entity\_state\_pdu\_parameters** main window.

From the **File** menu, the user is prompted for a JADS logfile. Non-entity-state PDU data are dumped from this file to an output file with the appendix '.nes'.

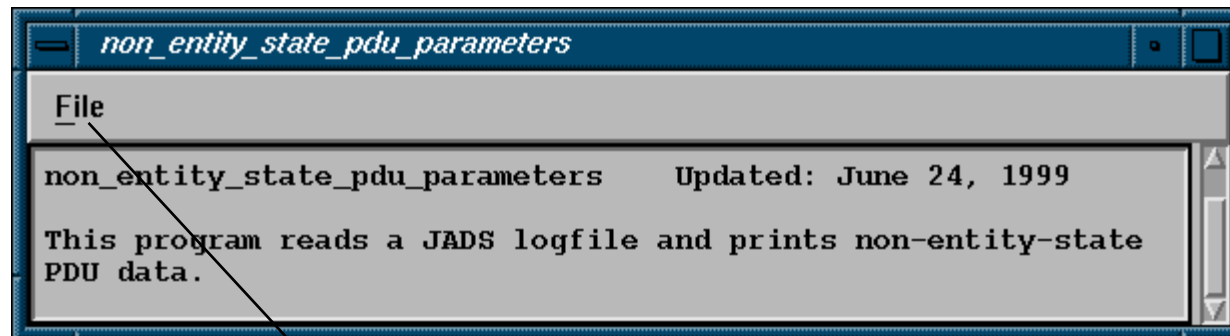

A sample of the output is shown.

For fire PDUs, the firer entity identification, location, and range are shown.

For the detonate PDUs, the firer entity identification and the result are shown.

## 4.2 Non-Entity-State PDU Parameters

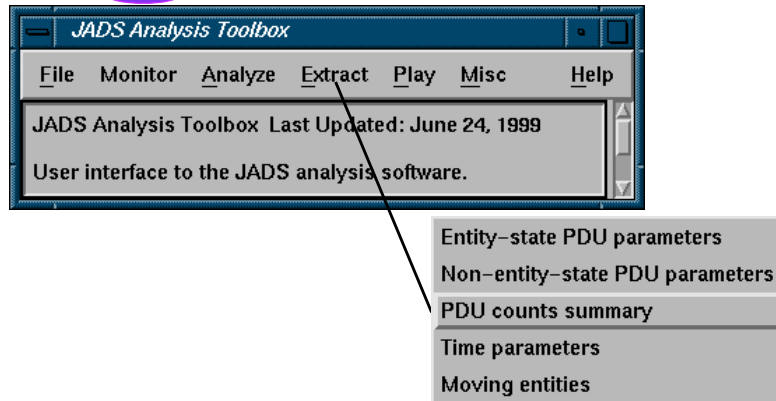

Get non-entity-state PDU parameters using std DIS time  
Get non-entity-state PDU parameters using timestamp  
Quit

## 4.3 PDU Counts Summary

The **Extract - PDU counts summary** menu item brings up the **Count PDUs** main window.

From the **File** menu, the user is prompted for a JADS logfile to be analyzed for PDUs.

The main window shows the source and output file locations. The output file has the appendix '.jstats'.

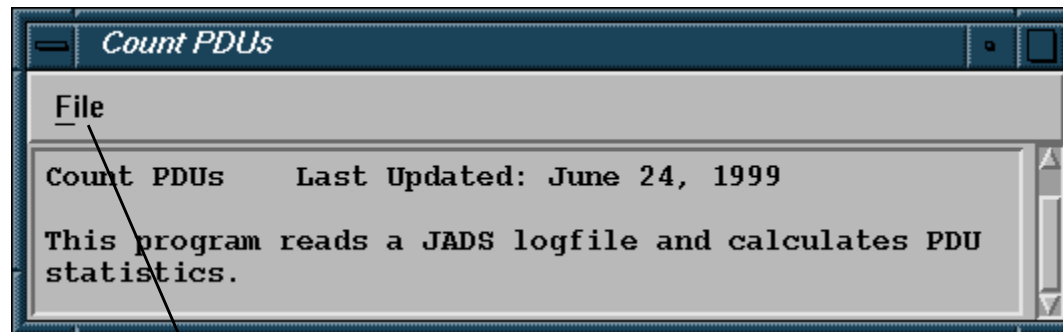

A sample of a \*.jstats file is shown.

The output contains

- the first and last PDU log times
- the number of PDUs received by PDU type for each site host
- the number of PDUs received by site host for each entity number

## 4.3 PDU Counts Summary

```

## 4.4 Time Parameters

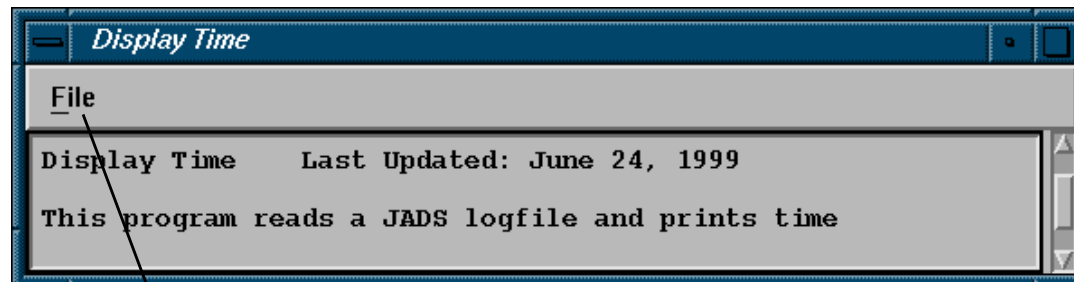

The **Extract - Time parameters** menu item brings up the **Display Time** main window. From the **File** menu, the user is prompted for a JADS logfile which is to be analyzed for time parameters.

After file selection, the user is prompted for start and stop log times (the area of interest) and whether DIS standard time or Timestamp (game time) is to be displayed for the PDU time. The input and output file locations are shown in the main window after completion. A sample output file is shown. The times displayed include

- the log time seconds (value of the first UNIX™ system word for time)
- the log time microseconds (value of the second UNIX™ system word for time)
- the log time milliseconds
- the log time "time of day," i.e., hh:mm:ss.sss
- the PDU timestamp value (the full 32 bits if game time is used, else the first 31 bits)
- the PDU milliseconds (after the appropriate first log time hour is added and hour rollovers are added as appropriate)

## 4.4 Time Parameters

## 4.5 Moving Entities

The **Extract - Moving entities** menu item brings up the **Moving Entities** main window. From the **File** menu, the user is prompted for a JADS logfile which is to be analyzed for PDUs.

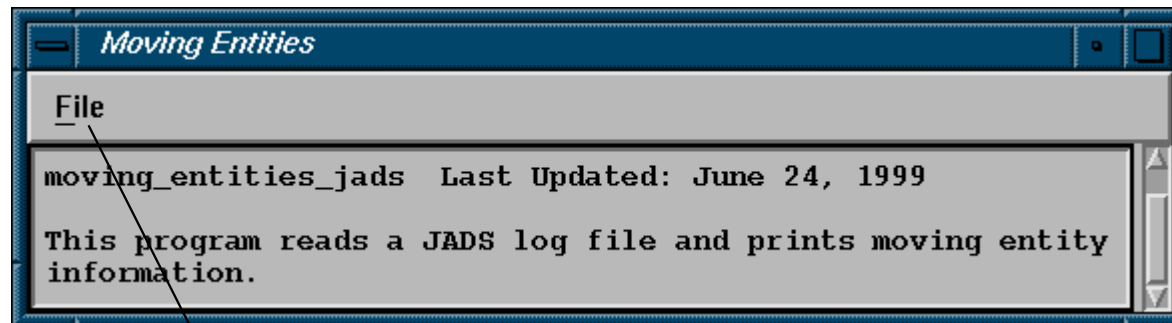

The locations of the input and output files are shown in the main window after the analysis is completed. For each minute of log time, the output shows

- the log start and game start time
- the number of PDUs received (during this minute)
- the number of entities that started moving (during this minute)
- the number of entities that stopped moving (during this minute)
- then, for each site:
  - the site number
  - the number of entities from that site that started moving (during this minute)
  - the number of entities from that site that stopped moving (during this minute)
  - the total number of entities moving from that site

## 5. Play

The **Play - Player** menu item allows the user to play back PDUs from a JADS logfile.

The user is prompted for the following in the **Playback Options** dialog:

- the port to use for issuing PDUs
- the exercise identification to use in the issued PDUs
- the PDU start time and stop time to use to start and stop the logfile
- the rate (if clicked, the rate is entered in the box as number of PDUs per second)
- the speed (if clicked, a number is entered in the box as the multiplication factor for the speed at which the PDUs are replayed, i.e., if 2, the PDUs are played back at double the normal speed),
- the PDU time (to be used), i.e., either use the PDU time that was recorded with the PDU or substitute the current time for the PDUs time

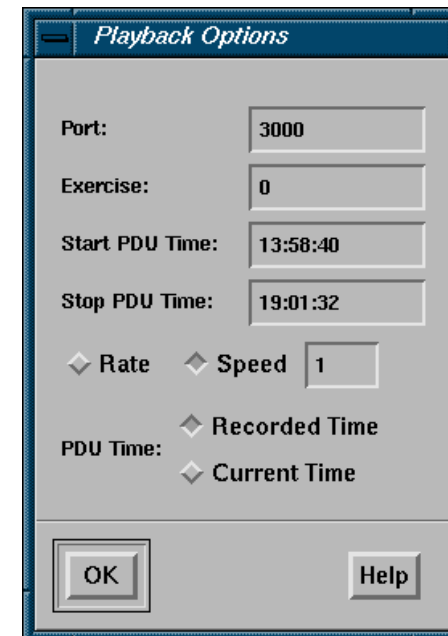

After the **Playback Options** are entered, the user is provided with a dialog to pause or quit the playback.

Quit

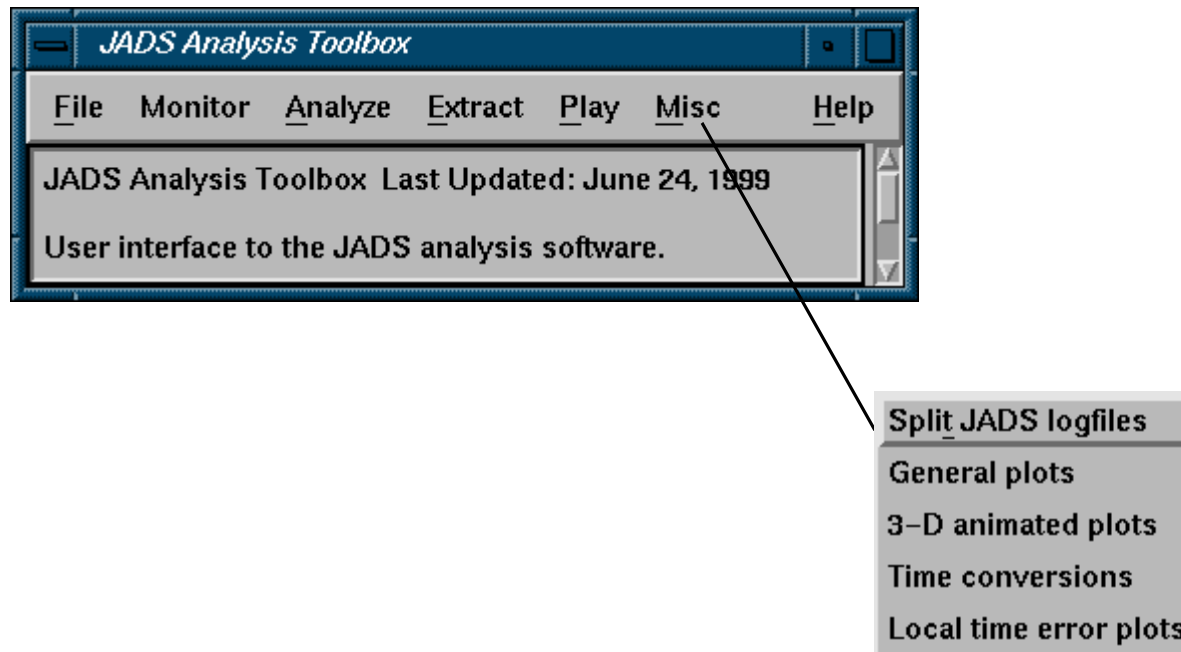

## 6. Miscellaneous

Miscellaneous routines are provided to the user in the **Misc** menu. The miscellaneous routines are presented on pages 46 - 55.

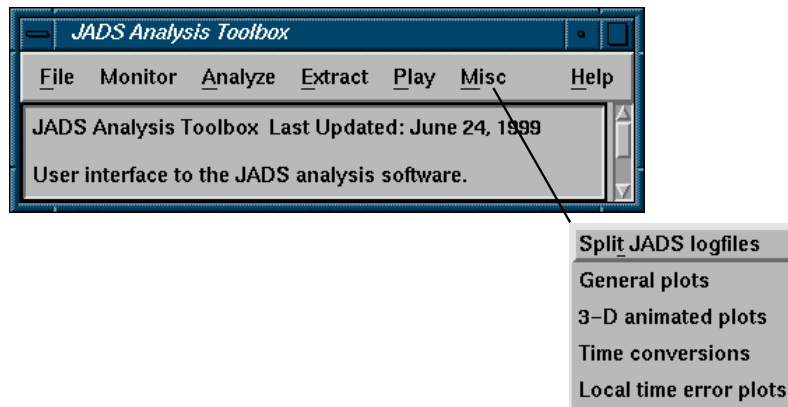

## 6. Miscellaneous

## 6.1 Split JADS Logfiles

The **Misc - Split JADS logfiles** menu item brings up the **split\_file\_jads** main window. From the **File** menu, the user is prompted for a JADS logfile. After selection of a logfile, the user is prompted for the log time start and end.

A new logfile is created that only contains PDUs from the selected log start to the log end time.

The new logfile has the same name as the source logfile, but the hours and minutes for the log start/end times are added to the file name. The new logfile has the appendix '.log' as do all other JADS logfiles.

A directory listing on the next page shows that the file

091698\_test90301\_ftsill.log

has been used to create another logfile that only contains data from log times 13:58 to 14:01 (hours and minutes). Its name is

091698\_test90301\_ftsill-1358-1401.log

091698_test90301_ftsill1.log
```

## 6.2 General Plots

The **Misc - General plots** menu item brings up the **general\_plots** routine that allows the user to plot data from any file provided the file is ASCII text/numeric data and that the number of fields in each record is the same.

The **File** menu item allows the user to select the file to be plotted. The program checks the first line of the file to see if it contains alpha characters and, if so, uses the fields to define the field names later presented to the user for selection of fields to plot. If the first line does not contain alpha characters, the values of the fields are used to define the names of the fields.

The **Plot** menu allows the user to plot a **Simple Plot** (y-values versus record number), an **XY Plot**, or a **3D (XYZ) Plot**.

The **Filter** menu allows the user to select a field and values for that field. Only those records which have the selected value in the field will be plotted. The dialogs for **Data Filter Selection** and **Filter Value Input** are shown.

After plotting, the user can use the **Canvas** menu to vary the plot scales, etc. This utility is very handy for the general plotting of data from any file.

## 6.3 3-D Animated Plots

The **Misc - 3-D animated plots** menu item allows the user to obtain 3-D plots in either static or animated (time-sequenced plotting) form.

Data may be from any text file that contains columns with data that represent x, y, and z values. For animated plots, PDU time must be available as the 3rd column (as it is in .gnu files).

## 6.3 Time Conversions

The **Misc - Time conversions** menu item brings up the **Time Convert** main window.

This simple dialog allows the user to calculate total seconds from days, hours, minutes, and seconds, and vice versa.

## 6.3 Time Conversions

## 6.4 Local Time Error Plots

The **Misc - Local time error plots** menu item brings up the **Plot Peerstats** routine which allows the user to plot peerstats files data.

If the environment variable PEERSTATS\_DIR is defined, the routine will bring up the files dialog pointed to that directory. The location of the XNTP peerstats files is specified by the user when XNTP is set up for a machine.

The user can double click on any of the files to see the peerstats time\_offset data plotted with each major division being 2 hours. Zero time is zero Greenwich mean time.

The plot has been set up with a **Standard Time Y Scale** that shows the JADS time error tolerance bands of + or - 1 millisecond. The user can **Change Y Scale** using the **Canvas** menu dialog shown. This will bring up another dialog into which the user can enter an upper y-scale value and a lower y-scale value, separated by a semicolon.
